Independent laboratory testing shows the components of EcoMelt® w/Activar® does not chemically attack good quality concrete that has been designed for exposure to winter weather and ice melter usage. However, the natural cycle of freezing and thawing of concrete by winter conditions can cause scaling damage to concrete. The use of any ice melting agent can increase these natural freeze/thaw cycles. Particularly vulnerable are those concrete surfaces in which sub-standard practices were used in the formulation, placement, finishing and/or curing stages of construction. Also vulnerable are all concretes that are less than one year old, precast steps, masonry (stone or brick), existing concrete that has exposed aggregate, is precast, prestressed, chipped, cracked, spalled, or weathered. The use of any ice melter on these types of surfaces is not recommended, and therefore can only be done at the user's own risk.

Unlike rock salt & potassium chloride, Peladow® calcium chloride readily attracts moisture from the atmosphere, allowing it to form a liquid brine very quickly and fan out beneath the ice, breaking its bond with the pavement. Other deicers lose their effectiveness quickly when they become diluted with water. But even when diluted to 20% concentration, Peladow® keeps working down to -4 degrees F.
